Task 4

- Create **multiple versions of the dataset** using different feature combinations and train multiple machine learning models.
- **Evaluate and compare** the performance of the models using appropriate evaluation metrics.
- Identify the best-performing model based on the evaluation results.
- Analyze the selected model using **SHAP values** to understand feature contributions.
- Evaluate and interpret **ROC Curve** and **AUC Score** for the best-performing model.

Deliverables

1. PPT presentation containing:
2. List of models trained and evaluated.
3. Comparison of model evaluation metrics.
4. ROC Curve and AUC analysis of the selected model.
5. SHAP value interpretation and key findings.
6. Justification for model selection.
7. Explanation of the dataset splitting strategy and feature combinations used.
